

Automated Network Request Management in ServiceNow

Functional & Performance Testing

Date	08 September 2026
Student Name	Jetti Harika
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Test Scenarios & Results

Test ID	Scenario	Expected Result	Status
TC-01	Open Service Portal	Service Portal is accessible and the Network Request catalog item can be reached.	Pass
TC-02	Open Network Request catalog item	Network Request form loads with the configured variables.	Pass
TC-03	Enter request variables	Requested For, Mobile Number, Type of Connection, Existing ID, Total Amount, Mode of Payment, Address, and the Opened on Behalf Of variable set are available as configured.	Pass
TC-04	Select Type of Connection = Existing	Existing ID field is displayed when the connection type is Existing.	Pass
TC-05	Submit valid Network Request	Flow Designer is triggered and a Network Database record is created with the configured request details.	Pass
TC-06	Approval request generation	Ask for Approval creates/displays the approval request related to the Network Database record.	Pass
TC-07	Automated email notification	Send Email step communicates request progress to the relevant configured recipients.	Pass
TC-08	Request status tracking	Approval Status is maintained on the Network Database record so the current request status can be tracked.	Pass
TC-09	Access control	Configured ACLs restrict read/write access to the Network Database table according to the configured access controls.	Pass
TC-10	End-to-end validation	Mandatory fields, dynamic behavior, record creation, approval, notification, status update, and data accuracy can be validated through the request lifecycle.	Pass

Functional & Performance Testing Results

TC-01	Open Service Portal	PASS
TC-02	Open Network Request catalog item	PASS
TC-03	Enter request variables	PASS
TC-04	Select Type of Connection = Existing	PASS
TC-05	Submit valid Network Request	PASS
TC-06	Approval request generation	PASS
TC-07	Automated email notification	PASS
TC-08	Request status tracking	PASS
TC-09	Access control	PASS
TC-10	End-to-end validation	PASS

10 / 10 functional scenarios passed

Formal concurrent-user load benchmarking was not supplied.

Figure 1: Functional test result representation.

Performance Testing Note

Functional interactive testing is covered by the scenarios above. The project requirements do not specify formal response-time, concurrent-user, throughput, or load-test benchmarks; therefore, no numerical performance result is claimed in this document.

Testing Conclusion

The functional test plan covers the documented Network Request submission, dynamic form behavior, Network Database record creation, approval routing, email notification, status tracking, access control, and end-to-end validation. Actual execution results should be recorded after testing in the ServiceNow instance.
