

Automated Network Request Management in ServiceNow

Idea Prioritization

Date	09 September 2026
Student Name	Jetti Harika
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Idea Prioritization

The prioritization below focuses on the core components of the Automated Network Request Management project — the Service Catalog submission, the automated flow, the approval process, and the underlying data and security model. Each component is rated High or Medium based on its importance to the project's business objective, its feasibility, its role in automation, and its dependency on other components.

Idea Group / Feature	Purpose in Project	Priority	Reason for Priority
Network Request Service Catalog	Service Catalog item (Category: Network) through which end users submit a network request for a new or existing connection.	High	Serves as the single entry point for all network requests and directly supports faster, more reliable service delivery for end users.
Network Request Form and Variables	Captures request details through variables such as Requested For, Mobile Number, Type of Connection, Existing ID, Total Amount, Mode of Payment, and Address, along with the Opened on Behalf Of variable set.	High	Captures the information required to process a request accurately and reduces manual effort and error at the point of submission.
Flow Designer Automation	Automates the request lifecycle using Get Catalog Variables, Create Record, Send Email, Ask for Approval, If/Else flow logic, and Update Record, triggered on catalog submission.	High	Delivers the end-to-end automation of the request lifecycle, which is the central business objective of the project.
Approval Routing	Ask for Approval step and Approval Request related list route each submitted request for approval, with Approval Status maintained on the Network Database record.	High	Enforces a standardized, auditable approval process before fulfilment, meeting compliance needs and approver expectations.
Network Database Record Creation	Create Record step generates a Network Database record capturing Database Number, Assignment To, Mobile Number, Total Amount, Mode of Payment, Type of Connection, Customer Address, Approval Status, and Requested For.	High	Establishes the centralized record that IT Admins and the Network Fulfilment Team rely on to execute and track network changes.
Dynamic Form Behaviour	Catalog UI Policy displays the Existing ID field only when Type of Connection is set to Existing.	Medium	Improves data accuracy for existing-connection requests but is a refinement built on top of the core form rather than a standalone requirement.

Idea Group / Feature	Purpose in Project	Priority	Reason for Priority
Email Notifications	Send Email step within the flow communicates request progress to relevant stakeholders.	Medium	Improves visibility and communication, but the request can still progress through the flow without it.
Request Tracking / Status Visibility	Approval Status field on the Network Database record allows the current standing of a request to be viewed.	Medium	Adds visibility for requesters and approvers, but depends on the Network Database record already being created.
Access Control	Default ACLs and Access Control Rules on the Network Database table restrict read/write access to sensitive fields based on role.	Medium	Protects sensitive fields in line with IT and security policy, and depends on the Network Database table already being in place.
Validation and Testing	Mandatory fields, auto-populate logic, and approval state validation are confirmed through unit testing, end-to-end simulation, and User Acceptance Testing.	Medium	Confirms the reliability of the automation and data before go-live, and is carried out once the core features are built.

Prioritization Overview

The card view below summarizes each project component alongside its assigned priority level.

Network Request Service Catalog	High
Network Request Form and Variables	High
Flow Designer Automation	High
Approval Routing	High
Network Database Record Creation	High
Dynamic Form Behaviour	Medium
Email Notifications	Medium
Request Tracking / Status Visibility	Medium
Access Control	Medium
Validation and Testing	Medium
