

Project Design Phase

Solution Architecture

Date	09 September 2026
Student Name	Jetti Harika
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Solution Architecture

The architecture bridges the employee/requester-facing Service Portal experience with ServiceNow application configuration, validation rules, approval tracking, and the backend network request table. List views give approvers and network teams operational visibility across the request lifecycle.

Automated Network Request Management - Solution Architecture

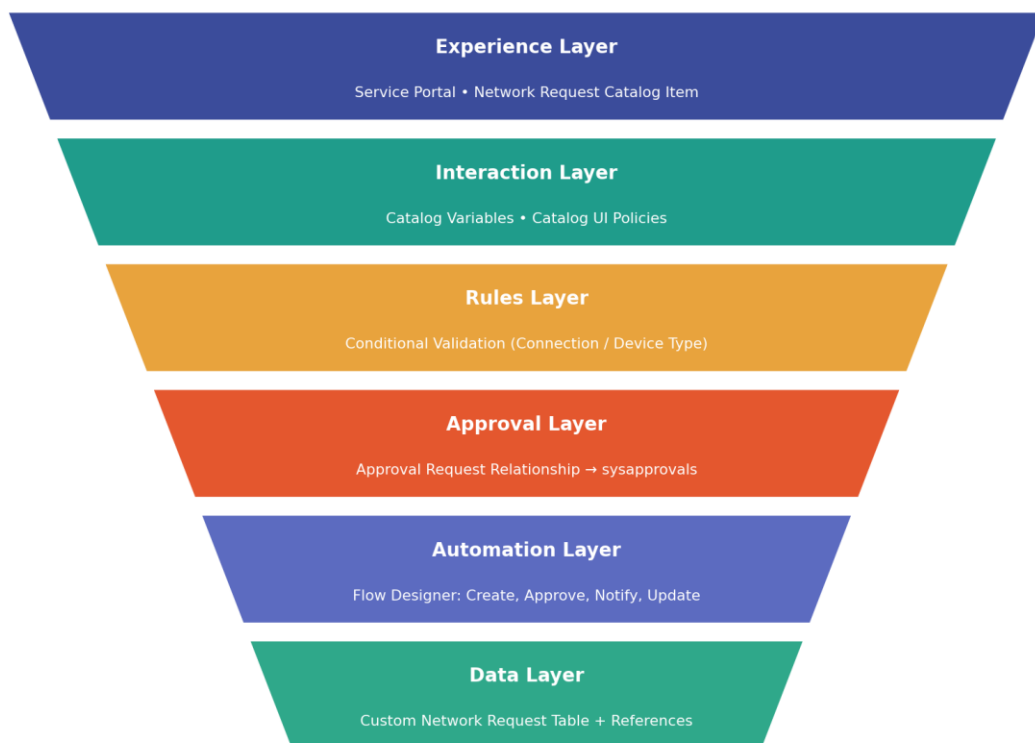

Figure 1: Automated Network Request Management solution architecture.

Layer	Components	Responsibility
Experience	Service Portal, Network Request catalog item	Provides the requester-facing submission form.
Interaction	Catalog Variables, Catalog UI Policies	Dynamically shows or hides fields based on user selections (device type, connection type).
Catalog	Network Request catalog item (order 100, 200, 300, ...)	Collects structured request variables such as request type, access level, and business justification.
Rules	UI Policies (e.g. "types of devices = Others", "types of Connection = Existing")	Validates input and controls field visibility/mandatory state.
Approval	Approval Request relationship (Database table → sysapprovals, Active)	Links approval records to each network request for tracking and reporting.
Automation	Flow Designer flow "Network Request" — Get Catalog Variables, Create Record, Ask for Approval, Send Email, Update Record	Orchestrates the request lifecycle from submission to fulfilment.
Data	Custom network request table (with standard platform tables)	Persists request records with request type, access level, justification, and related configuration items.
References	sys_user, network configuration items	Supplies reference data used by the catalog and automation.
